

ST series concealed hinges' snap-on mechanism improved

The improved ST hinge snap-on mechanism ensures a firmer hinge to plate attachment and a more consistent life-long performance. The stiffer design with rotary locking action provides a tighter connection which enhances the hinge stability and prevents the door sag. The increased firmness also allows for a smoother soft closing action. The SafeLock function at the rear of the snap-on mechanism prevents accidental detachment of the door when the door is forced past the maximum opening angle.

The improvement is applied to the full range of ST series hinges and has no impact on the existing base plates and current drilling specification. [More >>](#)
