Lama damper

Multi-purpose damping technology for various high-volume applications ensures a reliable and consistent performance over high production runs

The latest addition to the TitusPlus Group's range is the Lama damper, a multi-purpose damping technology for various applications in furniture functional systems. It results from the application of TitusPlus' extensive expertise in the design and production of high volume furniture hardware to damper technology, producing a damper with consistent and reliable performance.

The use of the Lama damper ensures a smooth damping action at any closing speed and reliable closing. The damping force, working stroke and size of the damper can be easily adapted to customer needs. The new damper's consistency in performance is a result of careful design that allows for efficient automated production and minimises the risk of variations in quality. The Lama damper is manufactured at the Group's main facility, in Dekani, Slovenia using innovative manufacturing technology designed and produced by its own Lama Automation division and following the TitusPlus philosophy of fully integrated manufacturing. It incorporates automated 100% quality control checks for consistent quality over high volume production runs and the sealing process eliminates the risk of oil leakage.

Thanks to its efficient modular design, the Lama damper can provide hardware manufacturers with custom solutions for various furniture and other applications.
